
Three histories at $M = 4 \times 10^{-31}\,M_P$, one-loop law (spectrum U4-U17-v1, $c_a = 1$)
$A = 0.05$, $\beta = 1.0775$: the largest share of K failing at a wall
199 generations, parking share 0.0011
$A = 1$, $\beta = 2$: a typical surfing history
45 generations, parking share 0.00013
$A = 10$, $\beta = 2$: the largest A
7 generations, parking share 9.5e-07
$r_\chi E_{\text{field}}$
$r_\chi E_{\text{tracker}}$
matter-like excess
(share of ρ_R)
margin $\ln(p/m)$ of each generation
(size: its share of K)
$1 + z_E$ (time runs to the right)
birth
worst later wall
tracker
ln 10 (the integrator's warning)
