
$M = 4 \times 10^{-31}\, M_P$, $\phi_* = 5\, M_P$: do the quanta stay relativistic? (spectrum U4-U17-v1, $c_a = 1$; a zero share on the bottom axis)
max $r_\chi E_{\rm field}$ (share of ρ_R)
$E_{\rm field}$ today (share of ρ_χ)
worst birth margin $\ln(p/m)$
worst reflection margin $\ln(p/m)$
share of K failing at a wall
parking share of K (no spectrum)
β
one-loop law: range over A = 0.05, 0.1, 0.2, 0.5, 1, 1.5, 2, 3
one-loop law, $A = 1$
one-loop law, $A = 3$
one-loop law, $A = 5$
one-loop law, $A = 10$
fixed law, $\alpha = 0.1$ (weighted generations only; no other measure)
fixed law, $\alpha = 0.01$ (weighted generations only; no other measure)
not at the wall before BBN ($\beta < 1.066$)
surfs the electroweak kick ($\beta > 3.000$)
analytic QCD threshold $\beta = 1.1074$
margin $= \ln 10$ (the integrator's warning)
